

ASTRONYMS IN ANCIENT BELARUSIAN AND CHINESE TEXTS

ALENA RUDENKA, ANASTASIA PUTILINA

Belarusian State University, Belarus

Abstract: The paper deals with one of the manuscripts of the National Library of Belarus – # 091 / 276K Vilno Collection. Particular attention is given to unpublished texts of the Collection (pages 60–89). There are many names of stars and constellations translated from different languages and connected with different myths. The names of constellations in the manuscript are compared with similar names in the Chinese *I Ching* (“Classic of Changes”) and the *Historic Records* by Sima Qian; some similarities in the principles of constellations’ naming and the organization of astronomic systems are identified.

Keywords: manuscript, names of stars and constellations, Vilno Collection, *I Ching*, *Historic Records*.

The aim of this paper is to show general principles for the nomination of constellations. A study on a similar topic was presented at ICOS 2014 in Glasgow on material consisting of Slavic and German dialect astronyms (Ivashina and Rudenka 2014). The material of this article comprises ancient Chinese astronyms from the *Book of Changes* and the *Records of the Grand Historian* by Sima Qian, as well as astronyms from the Old Belarusian manuscript of the 16th century – the Vilno Collection.

The Vilno Collection is manuscript # 091 / 276K from the National Library of Belarus. The *I Ching* ([i tɕíŋ]), also known as the *Classic of Changes* or *Book of Changes*, is an ancient Chinese divination text and the oldest of the Chinese classics. Possessing a history of more than two and a half millennia of commentary and interpretation, the *I Ching* is an influential text read throughout the world, providing inspiration to the worlds of religion, psychoanalysis, business, literature, and art. Originally a divination manual in the Western Zhou period (1000–750 BC), over the course of the Warring States period and early imperial period (500–200 BC) it was transformed into a cosmological text with a series of philosophical commentaries. The *Records of the Grand Historian*, now usually known as the *Shǐjì*, the *Historic Records*, is a monumental history of ancient China and the world finished around 94 BC by the Han dynasty official Sima Qian after having been started by his father, Sima Tan, Grand Astrologer to the imperial court. The work covers the world as it was then known to the Chinese and a 2500-year period from the age of the legendary Yellow Emperor to the reign of Emperor Wu of Han in the author’s own time. The *Records* has been called a foundational text in Chinese civilization.

Among astronyms, there are old and new, scientific and folk names. Most of the old scientific names were formed on the basis of folk ones; certainly, these names are possible only for the visible objects of the sky. Precisely such astronyms will be discussed later.

There is a universal feature in all astronomic systems that does not depend on a specific language. It is the principal difference between the nomination of stars and planets and the nomination of constellations. The aforementioned and others are objects of the visible sky, but stars, united in constellations, have nothing in common. A man who looks at the sky groups stars in constellations. It means that constellations, unlike objectively visible stars and planets, are a figment of imagination. The same constellation correlates with different images: people, animals, objects, etc.

For example, in Belarusian dialects the Big Dipper is called *Вялікая Мядзведзіца* (*Bol'shaja Medvedica*) 'a big bear'; *Світальна, Стажар'е* (*Svitalna, Stazharje*) 'light'; *Апалонічак, Коўшык* (*Apalonichak, Kowshyk*) 'a dipper'; *Воз, Карэта, Калясніца, Павозачка, Брычка* (*Voz, Karefa, Kalyasnitsa, Pavozachka, Brychka*) 'wagon, cart'; *Конь (Kon')* 'horse'; *Лось (Los')* 'a moose'. Germanic names of stars and constellations are also plentiful: the Great Bear in English is called *Ursa Major* (in the German language there is the same name from Latin), *the Great Bear, the Charles' Wain*; asterism *the Big Dipper, the (Star) Plough, the Saptarishi* (< seven rishis). Germ. *der Große Bär* is also called *der Große Wagen, Wotanswagen, Irmineswagen, Karlswagen, Theiws Wagen, Himmelswagen, Wagen am Himmel, Eliaswagen, Peterswagen, Mariaswagen, Davidswagen, Wagen des Dietrich von Bern*.

The image of an animal poorly correlates with the shape of a constellation. Nevertheless, the embodiment of an animal in a constellation was well conceptualized in Antiquity. The reason is that names of constellations reflected the ancient worldview and the very process of perception of the world by the ancients.

In modern China the European system of major stars and constellations, which goes back to the ancient tradition, is known (in this case, semantic calques are used). There is also the Chinese, more ancient system – to be more precise, several different systems. The ancient Chinese view of the starry sky is fixed in two manuscripts: the *Book of Changes* and the *Records of the Grand Historian* by Sima Qian.

According to the ancient Chinese astronomic system, the sky is divided into five parts, called 宫 [gun] 'palace, apartments'. These parts are compass oriented: 东宫 [Dun-gun] – *Eastern Palace*, 西宫 [Si-gun] – *Western Palace*, 南宫 [Nan-gun] – *Southern Palace*, 北宫 [Bay-gun] – *North Palace*. There also existed the *Central Palace*, which was associated with the emperor and his retinue. Each of the directions includes a large constellation, the name of which is associated with one of the mythical animals: 苍龙 [Tsan-lun] – *Azure Dragon*, 白虎 [Bai-hu] – *White Tiger*, 朱雀 / 朱鸟 [Zhu-tsue] – *Red Bird*, 玄武 [Suan-u] – *Black Turtle*. Here is the ratio of palaces and constellations:

- 东宫 [Dun-gun] – *Eastern Palace* / 苍龙 [Tsan-lun] – *Azure Dragon*;
- 西宫 [Si-gun] – *Western Palace* / 白虎 [Bai-hu] – *White Tiger*;
- 南宫 [Nan-gun] – *Southern Palace* / 朱雀 / 朱鸟 [Zhu-tsue] – *Red Bird*;

- 北宫 [Bay-gun] – *North Palace* / 玄武 [Suan-u] – *Black Turtle*.

In turn, these constellations are divided into twenty-eight “lunar houses” – 二十八宿 [èr shí bā xiù]. Twenty-eight constellations of the Chinese sky are important for astrological predictions and navigation.

The constellation *Azure Dragon* 苍龙 (eastern part of the sky) includes seven constellations: 氐宿 – *Basis*, 房宿 – *House*; 角宿 – *Horn*, 亢宿 – *Neck*, 心宿 – *Heart*, 尾宿 – *Tail*, 箕宿 – *Basket*. The *Red Bird* 朱雀 (south) includes 鬼宿 – *Daemon*, 柳宿 – *Willow*, 星宿 – *Seven Stars*, 翼宿 – *Wing*, 井宿 – *Well*, 张宿 – *Bow*, and 轸宿 – *Cart*. In the western part of the sky, *White Tiger* 白虎 consists of 壬宿 – *Scepter*, 娄宿 – *Shackles*, 参宿 – *Merit*, 胃宿 – *Stomach*, 鬼宿 – *Hair*, 鬯宿 – *Neb*, and 毕宿 – *Pitchfork*. The northern part of the sky corresponds to the constellation *Black Tortoise* 玄武 and includes 女宿 – *Virgo*, 虚宿 – *Eftiness*, 危宿 – *Roof*, 室宿 – *Chamber*, 壁宿 – *Wall*, 北斗星 – *Big Dipper*, and 牛宿 – *Bull*.

The analysis of the Chinese names of constellations showed that the following principles of naming were used:

1. The *metonymic* principle: A is a *part* of a larger constellation B, for example, constellations *Horn*, *Neck*, *Heart*, *Tail* in the eastern part of the sky – *Azure Dragon*;

2. The sky is the “upper land” (the separation of the celestial sphere into “palaces”, the constellation *House* in the eastern part of the sky, etc.);

3. The *metaphorical* principle: the similarity of the constellation’s *shape* (form) to the object or phenomenon of reality (*the Dipper* in the constellation of *the Black Turtle*, etc.).

4. The “*Mythic Model Principle*”, according to George Lakoff: “If there is a basic cultural myth in which B is A, then it is natural for B to be in the same category as A” (Lakoff 1986: 2–3) (= in our case it means to have the same name – A.R.). For example, the origin of the name of the constellation *Cart* in the southern part of the sky is associated with the myth of the goddess Shihe, who took out one of the ten suns on the cart each day.

The constellation *Virgin* has other Chinese names: *Uniuj*, or *Siuniuj* – *the Maid*, *Zhiniuj* – *the Weaver-she*. According to an ancient Chinese legend, *Weaver* was married to *Bootes* (*Herdsman*) in the same constellation of *the Red Bird*, and she stopped weaving. As punishment, the Lord of Heaven divided them by *the Milky Way*, and now they meet once a year on the seventh day of the seventh moon. By the way, for the *Milky Way*, the ancient Chinese had three names: 银河 [yinhe] ‘silver river’, 星河 [xinghe] ‘star river’ and 天河 [tianhe] ‘heavenly river’.

5. Nomination with names of *instruments* (not always similar in shape) (*the Pitchfork*, *the Basket*);

6. The *quantitative* principle (for example, *the Seven-Stars*).

These principles are arranged in descending order: from the most frequent to less frequent ones. About half of the selected constellation names are characterized by multiple motivation, which means that naming principle can not be defined precisely. For example, the above-mentioned constellation *the Cart*, whose name is connected

with the myth, looks a bit like a cart; so, the name may be based on the metaphorical principle of similarity in shape.

These ideas and principles are to be compared with Old Belorussian and in general Indo-European names of constellations. The second part of this research is devoted to the Old Belarusian manuscript the Vilno Collection. The Vilno Collection is a partially published manuscript of the 16th century from the Belarusian National Library. In this paper particular attention is given to unpublished texts of the Collection (pages 60–89), which has astrological content and includes several small articles. These texts were translated from a Hebrew manuscript and consist of excerpts from an ancient astrological treatise. Thus, there are many names of stars and constellations translated from different languages and connected with different myths – the text can be classified as hybrid.

In the Vilno Collection there are the names of all astrological signs and zodiacal constellations. The manuscript is very beautiful: on the margins of the book there are drawings of all the signs of the zodiac. The very word *Zodia*, denoting the zodiacal constellation, is of Greek origin and came to Old Belorussian through Latin. In Greek ζώδιον meant ‘animal, animal image’, later – ‘zodiac sign’, since the zodiacal constellations were represented by ancient Greeks as images of various animals and had corresponding names. The Ancient Greek names of zodiacal constellations go back to the astronyms of Ancient Mesopotamia. The ancient Greeks made calques of the Sumerian and Akkadian names and adapted them to their mythology, choosing the corresponding myths about each constellation (Куртик 2002: 81–82). This means that the Greek and Latin names of the zodiacal constellations are calques of earlier astronyms with secondary motivation according to the mythic model principle.

In turn, almost all the Slavic names of zodiacal constellations mentioned in the Old Belarusian manuscript are calques of Latin or Greek names. They do not differ from modern ones: *водолей* (*vodolej* ‘the Water-bearer’ is a calque of Lat. *aquarius*), *козеирогъ* (*kozeirog* ‘the Capricorn’ – Lat. *caprecornus*), *рыбы* (*ryby* ‘the Fish’ – Lat. *piscis*), *стрелецъ* (*strelec* ‘the Sagittarius’ – Lat. *sagittarius*), *овенъ* (*oven* ‘the Ram’ – Lat. *aries*), *левъ* (*lev* ‘the Lion’ – Lat. *leo*), *ракъ* (*rak* ‘the Cancer’ – Lat. *cancer*). Latin names, written in Latin and Cyrillic, are used in the manuscript in parallel with Slavic ones: Lat. *aquarius* – *оуквариу* (p. 67); *рыбы* [*ryby*] ‘the Fish’ – Lat. *piscis* – *нисмес* (p. 68); *телецъ* [*telets*] ‘the Bull’ – Lat. *taurus* – *тауор* (p. 68); *дева* [*deva*] ‘the Maiden’ – Lat. *virgo* – *виръго* (p. 70); *овенъ* [*oven*] ‘the Ram’ – Lat. *aries* – *аріу* (p. 68); *близнецы* [*bliznetsy*] ‘the Twins’ – Lat. *gemini* – *емены* (p. 70); *козеирогъ* [*kozerog*] ‘the Capricorn’ – *caprecornus* – *капрекоръно* (p. 67).

In one of the articles a list of twelve astrological signs is given, in which the Slavic and Greek names are duplicated in the original and transcribed in Cyrillic letters: *Водолей* [*vodolej*] ‘the Aquarius’ – Greek ὕδροχόος – *иудрухос*; *рыбы* [*ryby*] ‘the Fish’ – Greek ἰχθύς – *иухиу*; *овенъ* [*oven*] ‘the Ram’ – Greek κριός – *крюос*; *телецъ* [*telets*] ‘the Bull’ – Greek ταῦρος – *таврос*; *левъ* [*lev*] ‘the Lion’ – Greek λέων – *леон*; *весы* [*vesy*] ‘the Scales’ – Greek ζυγόν – *зиго*; *дева* [*deva*] ‘the Maiden’ – Greek παρθένος – *парфено*;

близнецы [bliznetsy] ‘the Twins’ – Greek διδύμα – διδύμο; козерог [kozerog] ‘the Capricorn’ – Greek αἴγόκερως – εροκερος; Greek καρκίνος ‘the Cancer’ – κανցιψър; Greek τοξότης ‘the Sagittarius’ – τοξεμος; Greek σκορπίος ‘the Scorpio’ – скорпион (Золотарь 2016: 135–137).

Thus, in the Vilno Collection, as in a later manuscript than the *Book of Changes* or the *Historic Records* by Sima Qian, there are only ancient Latin and Greek astronyms. These names are written in the original (in Latin or Greek), in Cyrillic letters or as Slavic calques.

Dialectal Indo-European names of stars and constellations provide more opportunities for research into naming constellations than their literary names, which go back to ancient Latin and Greek names. Dialectal data show that the Indo-European system of the starry sky is holistic and similar for speakers of different Indo-European languages. The reasons for this similarity are the general laws of conceiving and comprehending the starry sky, as well as the early (common Indo-European) origin of astronyms, which were used primarily for orientation. The knowledge about stars (planets) and constellations was transmitted from generation to generation and from tribe to tribe as a part of this experience.

Indo-European, primarily Slavonic and Germanic, dialectal astronyms were presented at ICOS 2014 in Glasgow. The following naming principles were found:

1. Names may go back to *cosmogonic myths*, based on the so-called “Mythic Model Principle”. For example, Rus. *Volosozhary* ‘the Pleiades’ is associated with the name of the god *Veles*, an important attribute of which is *volosy* ‘hair’, or wool. It is interesting that the holidays dedicated to *Veles* are in spring, when the Pleiades rise.

2. The similarity of constellations’ *shape* to the object or phenomenon of reality (Rus. *ковши*, Bel. *аналонічак*, *коўшык*, *корац*, etc. with the meaning ‘the Dipper’). This semantic model is represented in all Indo-European languages, as well as in many others: in the Finno-Ugric, Turkic languages; we have also seen a similar Chinese astronym 北斗星 ‘Dipper’).

3. The *quantitative* principle (Germ. *Drei Mäher* ‘three mowers’, *Drei Könige* ‘three kings’, *Drei Marien* ‘three Marys’, *Drei Stäbe* ‘three sticks’, *Drai Holzhacker* ‘three lumberjacks’, Polish *Trojki* ‘three’, *Trzy Siostry* ‘three sisters’, *Trzy Króle* ‘three kings’, etc. – names of the constellation Orion, in which three stars are clearly distinguished).

Similar to Orion associated with number three, the Pleiades is associated with seven, cf. Germ. *Siebengestern* ‘seven stars’, *Sieben Schwestern* ‘seven sisters’, Engl. *the Seven Sisters*, Old Polish *Siedem Gwiazd*, Slovenian *Sedem Zvezd* ‘seven stars’, etc. Three and seven are magic numbers for all Indo-Europeans, so seven was not only seen in the Pleiades – see, for example, Engl. *Saptarishi* (< *seven rishis* ‘seven wise men’), which is the name of the Big Dipper and goes back to Indian cosmology.

4. Position in the sky (Rus. *ко́л* [kol] ‘pole’ and Germ. *Fixstern* ‘fixed pole’ emphasize the most important feature of the Polar star – its immobility). The idea of a stake or pole is also known for Turkic and Finno-Ugric languages.

5. The names reflect economic relations; for example, the idea of celestial

mowing and mowers is connected with Orion (Bel. dial. *Kасуы* [Kascy] ‘mowers’, etc.) (Ivashina and Rudenka 2014; Ивашина 2010: 274–275).

As we can see, the principles of astronomic attribution are similar in Indo-European and Chinese languages, despite the fact that the astronomic systems themselves are different.

A comparison of astronyms in different languages allows us to determine the universal features of the organization of astronomic systems:

- the idea of heaven as the “upper land”;
- connection with the calendar, change of seasons, and agricultural work;
- the division of the visible starry sky into segments in accordance with the calendar and/or compass;
- ecliptic – imaginary line of movement of the Sun and visible planets;
- zodiac or its analogue – the visible part of the starry sky associated with the ecliptic;
- the zodiacal constellations are represented as “houses” of the Sun and moving planets;
- highlighting significant stars and constellations on the visible part of the starry sky for navigation and astrological purposes (zodiacal belt);
- connection of the key zodiacal constellations with the names of culturally relevant animals.

Conclusion

A comparison of manuscripts and dialects of different languages and different cultural traditions made it possible to determine not only the universal features of the organization of astronomical systems, but also the basic principles of naming constellations: the metonymic principle, the metaphorical principle, “the Mythic Model Principle”, the quantitative principle, and the principle of reflecting economic relations.
